

ROSE WOOD
4.0 Sustainable Wood
for Europe

Project No: 862681

Project acronym: ROSEWOOD4.0

Project title

EU Network of Regions On Sustainable WOOD mobilisation ready for digitalisation

Programme: H2020-RUR-2018-2020 (Rural Renaissance)

Topic: RUR-15-2018-2019-2020 Thematic networks compiling knowledge ready for practice

Start date of project: 01.01.2020

Duration: 24 months

Deliverable D1.2

Progress Report on Best practices and Innovations

Author: Uwe Kies (InnovaWood)

Due date of deliverable: 31.12.2020

Actual submission date: 05.11.2021

Work Package	WP1
Associated Tasks	T1.1, T1.2, T1.3
Covered Period	M1-M12
Deliverable Lead Partner	InnovaWood (IW)
Version	1.3

Dissemination Level		
PU	Public	X
PP	Restricted to other programme participants (including the Commission Services)	
RE	Restricted to a group specified by the consortium (including the Commission Services)	
CO	Confidential, only for members of the consortium (including the Commission Services)

Abstract

The D1.2 report documents the Rosewood4.0 partners' progress and outcomes to collect, select and validate a set of relevant Best practices and Innovations (BP&I) in digitally supported forestry and wood mobilisation solutions. It describes the common survey of data collection and assessment and the results. The knowledge repository including the common factsheet definition, the editorial process and the multilingual access, and the implementation of the beta version of the online platform are described. The series of Regional Hub validation workshops together with experts and stakeholders are documented, which contributed to the selection of BP&I and stimulated further networking and knowledge exchange between the five Hubs. The analysis of their distribution across the Hubs allows to pinpoint different groups of priority. The report includes the full list of the 457 Best practices and innovations identified during the survey, which includes the data collected during both projects: Rosewood (2018-2020) and Rosewood4.0 (2020-2022).

Deviation

Justification for the delay of the submission of the deliverable report: Following the restrictions opposed by the COVID-19 pandemic, the Hub workshops meetings could not be organized as physical meetings and had to be held to a large extent online. This needed more communication between Hub leaders, partners, and external stakeholders. It thus required more time to review the large, collected list of best practice and innovations and complete the joint assessment. However, the deviation is not critical, because the results are convincing, and the implementation of the knowledge platform shows good progress.

1 Objectives and overview of progress

A main aim of the ROSEWOOD4.0 project is to collect suitable content about Best practices and Innovations (BP&I) in the field of sustainable wood mobilisation and digitalisation. The main objective is to speed up cross-regional learning and fertilisation about best practices and latest managerial, social and technological innovations, especially digital solutions facilitating the sustainable wood mobilisation.

InnovaWood (IW) and European Forest Institute (EFI) together with the consortium partners led a joint team effort to carry out a broad collection of BP&I and build up a knowledge base to make the content widely accessible through an online platform and aligned dissemination and communication activities. CESEFOR contributed to the technical realization of the knowledge repository, while SIG/S2i supports the management. All other project beneficiaries participated, in their roles as Hub Leaders and regional partners, to the collection, description and assessment of BP&I.

The main activities implemented comprised the following tasks, which are reported in the following:

- Screening of solutions and best practices implemented in EU regions
- Selection of relevant best practices & preparation of dissemination materials
- Clustering and validation of best practices selection between regions

The previous deliverable report D1.1 “Concept note Best practices and Innovations” elaborated the methodological guideline for the Hubs in the collection of BP&I. It defined the common approach for selection and validation of the BP&I including survey steps, definitions, and classifications, required parameters and key information for documentation of the BP&I, and proposed steps for the validation in participatory workshops with stakeholders. It also contains a first concept of the knowledge repository and a work plan for the implementation of the task activities.

This deliverable report D1.2 documents the accomplished collection, selection and validation of BP&I carried out jointly by the five Regional Hubs. The coordinated team effort together with external stakeholders in the validation workshops succeeded in an impressive collection of **457 BP&I** in total, with the majority coming from the Northern, Central-Western and South-Western Hubs. The four largest groups of BP&I belong to the domains “forest inventory, assessment, monitoring”, “harvesting, logistics, transport, safety”, “ownership, cooperation”, and “education, research, knowledge transfer”.

The first batch of **50 BP&I factsheets** of high priority to the Hubs has been completed and documented in the separate report D1.3. They contain short abstracts, visual materials and links to contacts and additional resources. In addition, a series of **26 short video clips** of BP showcases will be prepared. Currently, 15 short videos have already been created by the Hub partners and are used in the project dissemination.

All these results are now published online and made accessible in the **Rosewood4.0 knowledge platform** forestinnovationhubs.rosewood-network.eu (beta version online since Sep 2021). The platform has been tested by the consortium partners and is currently being presented to various external stakeholders in view of broad dissemination in the European forestry and wood industry community.

2 Screening of solutions and BP&I in EU regions

2.1 Definitions and classifications

2.1.1 Best practices and innovations

A '**best practice**' (BP) can be defined as an effective, superior technological or social solution to a typical common problem or barrier. A BP can consist of a specific improved product, tool, or process (e.g. a machine or a technique), but it can also represent a more complex system solution (e.g. a sophisticated information system, a management system, or a legal or governance process or multi-actor initiative). A BP is a state-of-the-art implementation of a solution with latest (digital) technology, that has a representative character.

A specific implementation of a BP in a local context can be called a 'best practice case'. For example, a lot of quite similar digital management platforms for private owners exist in different countries, which can be all considered as different cases of the same BP. These will also be selected, and the best ones presented to the other Hubs. Main aim is here to improve collaboration and knowledge exchanges between the different tools.

In contrast, an '**innovation**' is defined as a very novel solution that has been developed and tested so far only in an experiment, pilot or a demonstration project, but which is usually not yet implemented on a larger scale or under real market conditions. The level of maturity of an innovation is usually assessed by the Technology Readiness Level (TRL). Innovations are also relevant in knowledge transfer projects such as ROSEWOOD4.0, because they go beyond the current state-of-the-art and provide new impulses for local solutions.

Note that innovation does not only refer to the advancement of a technology or system, but also to the wider adoption of an existing, proven technology or system in another context, e.g., another sector or country (this can also be described as 'social innovation').

Several **classifications** are applied to categorize the BP&I dataset in an effective manner. The final version of descriptors will be a result of the further analysis and validation of the collected BP&I in WP1.

2.1.2 Domains

A **classification of domains** is used to organize the collection of BP&I, which also provides an effective structure for the repository. The domains correspond to main parts or activities along the forest-wood value chain from management of the forest ecosystem to final products and markets. The focus of ROSEWOOD4.0 lies on the forestry and raw material supply side, but BP&I of end uses are also considered in the sense that they can create higher demand for mobilisation of wood.

The domain classes include:

- 1 Inventory, assessment, monitoring
- 2 Ownership, cooperation
- 3 Forest management, ecosystem services, resilience
- 4 Forest disturbances, risks, disaster response
- 5 Harvesting, logistics, transport, safety
- 6 Products, markets, trade
- 7 Forest-based industries, bio/circular economy, value chain
- 8 Education, research, knowledge transfer (transversal)
- 9 Innovation management, digital hubs, clusters, exploitation
- 10 Financing, funding schemes

2.1.3 *Types of solutions*

BP&I will also be grouped into different **types of solutions**. Because ROSEWOOD4.0 focuses on digital solutions, this will allow to group together similar technological concepts and systems. These groups are used for characterization of the BP&I and offer another filter possibility in the repository. The types of solutions include:

- 1 Sensors, measurement equipment
- 2 Data standards
- 3 Data platforms, data hubs, open data
- 4 Modelling, DSS, simulation, optimization
- 5 Advisory and services tools for forest owners
- 6 Awareness, info portals, educational campaigns
- 7 Smart machinery, equipment
- 8 Operations optimization
- 9 Collaboration platforms, logistical hubs
- 10 Traceability tools
- 11 Joint forest management
- 12 Marketing platforms
- 13 Sustainable, bio-based, circular products, smart materials
- 14 Cooperative initiatives, networks, clusters
- 15 Smart biotechnologies
- 16 R&D platforms, testbeds, co-creation initiatives
- 17 Training, education, eLearning
- 18 Funding schemes, grants
- 19 Innovation contests
- 20 Other

2.1.4 Challenges for wood mobilisation

Based on the regional roadmaps, a list of common groups of challenges for wood mobilisation was specified. These correspond to typical barriers or issues encountered by stakeholders in their regional contexts. The BP&I were attributed as potential solutions to one or several challenges, which allows users to be easily directed towards them in the repository. The challenges are specified as follows:

- 1 Improve forest resilience and adaptation to climate change
- 2 Improve infrastructures and capacities of public actors
- 3 Activate private forest owners and cooperative forest management
- 4 Ensure a well-trained workforce through attractive skills development and education
- 5 Enhance economic and environmental performance of forest supply chains
- 6 Grow the forest-based bioeconomy through circular use and value-added products
- 7 Raise public awareness, social acceptance and political support for forestry
- 8 Other

2.2 Survey, data collection and raw database

Following the common approach, project partners have carried out a broad screening and collection of European best practices and innovations (BP&I) in their respective Regional Hubs. The survey included the following main steps:

1. During the survey, various sources were considered, e.g. successful initiatives and ongoing projects inside the Hubs, project reports and surveys, scientific literature, and checked for relevant BP&I.

2. Each Hub team compiled a long list of potentially interesting BP&I. At first, the partners had only to provide an initial list with some basic info about the BPI, e.g. titles, keywords, website, contacts.
3. The long list was collected in the form of a raw database, which is accessible as online shared document to all project partners. The advantage is that all partners have direct access to the latest update version and can immediately read and consider the BP&I also from the other Hubs. This practical solution was chosen, because the survey could start even without the real knowledge base being yet operational.
4. The collection of BP&I was developed by Hub partners with close feedback from other regional partners and experts. This interaction took place in the series of validation workshops and further bilateral exchange. The selection and validation step is described in detail in chapter 4.
5. The partners were then in charge to complete the documentation of BP&I as far as possible in the shared raw database, following the common format and pre-defined classifications. This step is the initial preparation of the factsheet information to be included in the knowledge platform.
6. InnovaWood cross-checked the data and ensured the consistency of the dataset and documented the progress in this report.

A major part of the survey was carried out during the first nine months of the project by all five Hubs and related project partners, where the first full initial list of more than 300 BP&I related to digitalisation was completed. Note that as a rule, the survey phase remains open, so that also newly announced or recently identified BP&I can be added continuously to the database by the partners. Thus, another 50 BP&I were identified later as a result from the continuous exchange with Hub experts and other regional initiatives.

2.3 Overview and first results of the BP&I collection

2.3.1 Hubs and countries

The current long list comprises in total **457 identified BP&I** entries from 24 countries (cf. Annex I, last version as of 1 November 2021). This includes **150** BP&I collected in the scope of the Rosewood 1 project (2018-2020) and **307** BP&I collected during the Rosewood4.0 project. The collected BP&I are distributed unevenly across the Hubs (Figure 1 & 2). The majority of BP&I were identified in the Northern Europe (NE), the Central-Western Europe (CWE) and the South-Western Europe (SWE) Hubs (339, 74% of total). The reason is that these represent the largest Hubs in terms of number and size of countries, plus these are the technologically most advanced countries in the domain.

Nevertheless, also the other Hubs (SWE South-Western Europe, CEE Central-Eastern Europe, SEE South-Eastern Europe) identified a large set of very relevant BP&I, so this survey confirms the truly European coverage of the ROSEWOOD4.0 project. In addition, several European-level BP&I (in most cases European funded-projects) as well as a few international examples were identified.

The collection includes national BP&I from 21 countries in Europe, with a focus on the countries represented in the consortium (Figure 3). The largest sets of cases are identified in Germany (DE, 79) and Finland (FI, 59), followed by Spain (ES, 40) Sweden (SE, 29), Austria (AT, 29), and France (PL, 28). One reason for this distribution that those countries participated in both EU projects, while the other countries joined only later for the second project Rosewood 4.0.

In the CWE Hub, a few BP&I from neighbouring countries not represented in the partnership were included. The collection includes also 17 EU-level project consortia, 3 from Canada (CA) and 1 international project.

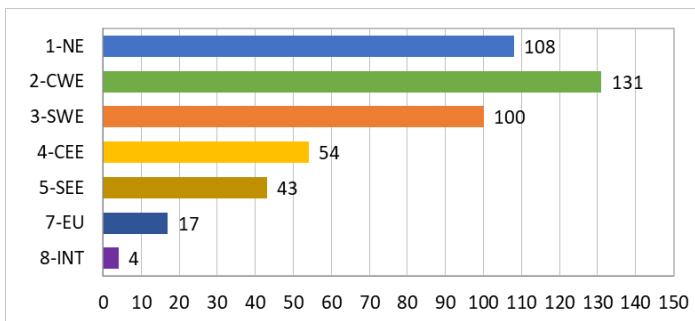

Figure 1 Number of collected BP&I in total per Hub (n = 457)

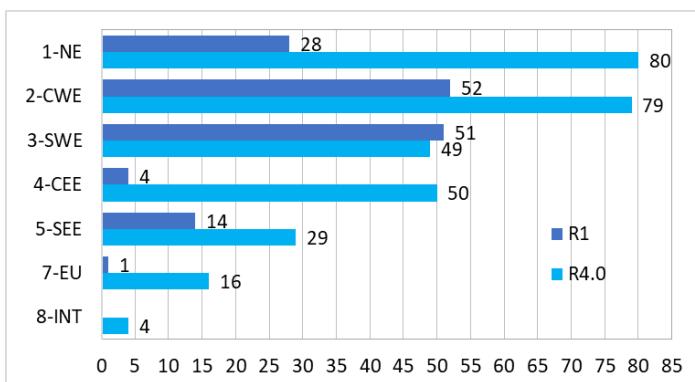

Figure 2 Number of collected BP&I in total per EU project (R1: Rosewood, R4.0: Rosewood 4.0; n = 457)

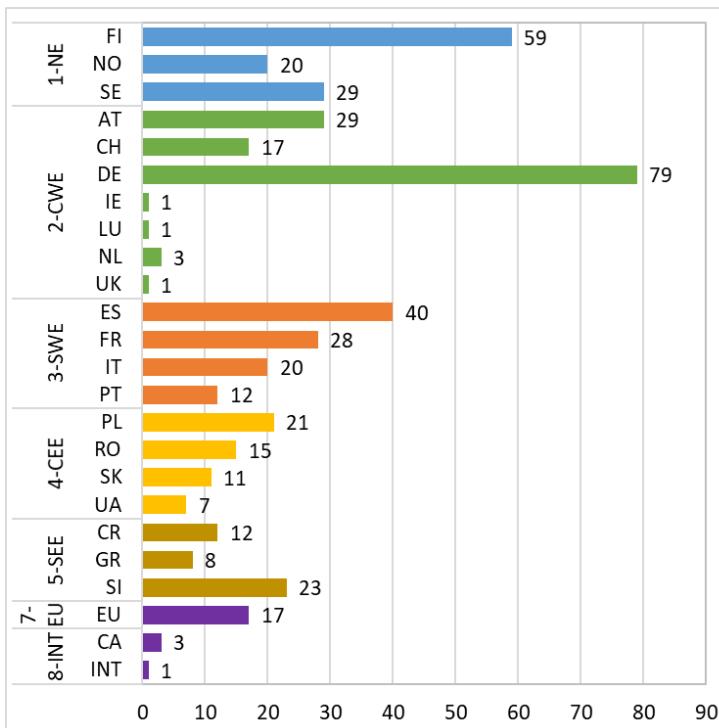

Figure 3 Number of collected BP&I in total per Country (n = 457)

2.3.2 Domains

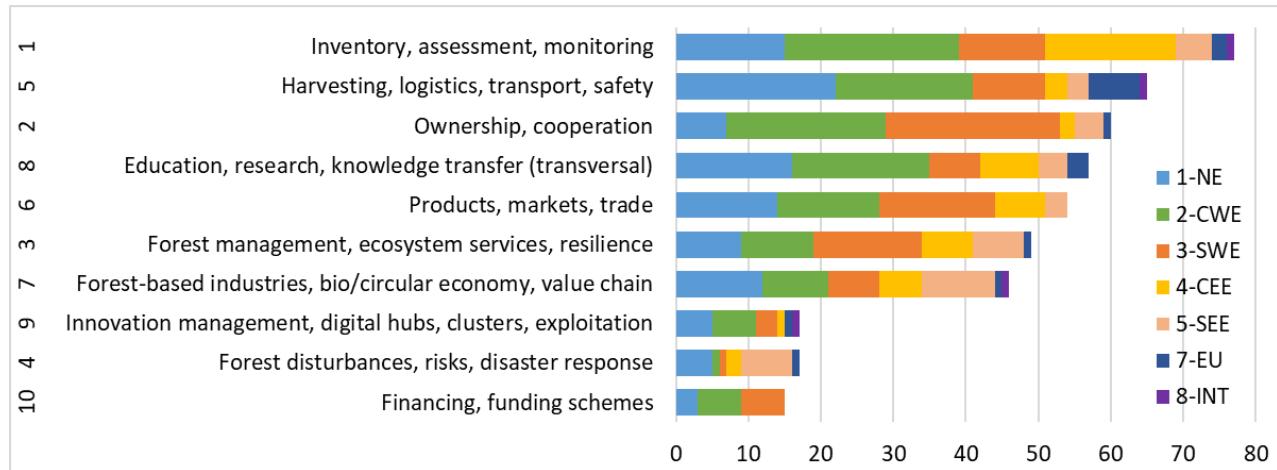

Figure 4 Number of collected BP&I in total per Domain (n = 457)

The BP&I collection covers a range of different Domains – i.e. themes and business areas – in forest management and forest-based industries (Figure 4).

- The largest group are BP&I in the domain of “Inventory, assessment, monitoring” (77, 17%). This is not a surprise, because most digital innovations in forestry occur in this field and are essential as they represent the groundwork to provide detailed, high-resolution data for innovative application.
- The second position are BP&I in the domain of “Harvesting, logistics, transport, safety” (65, 14%), which also show equally rapid development in recent years, and the third position is “Ownership, cooperation” (60, 12%), which includes many BP&I from the first Rosewood project.
- The fourth largest group is – interestingly - the important area of “education, research, knowledge transfer” (57, 12%). This result underlines the importance of digital solutions for transversal actions to strengthen knowhow and readiness to adopt innovative solutions.
- Other important groups that relate to the core of forestry are “forest management, ecosystem services, resilience” (49, 11%), and “forest disturbances, risks, disaster response” (17, 4%).
- Another quite significant group of BP&I represents “Products, markets, trade” (54, 12%), as well as the subsequent downstream “forest-based industries, circular economy, value chain” (46, 10%).
- Finally, two specific groups with an important supporting role represent “innovation management, digital hubs, clusters, exploitation” (17, 4%) and “financing, funding schemes” (15, 3%).

The identified BP&I according to the domains are also distributed in a balanced way across the different Hubs.

2.3.3 Types of solutions

Figure 5 Number of collected BP&I in total per Solution types (n = 457)

The collection of BP&I was also classified according to different “Types of solutions”, which represent similar groups of technological solutions and applications (Figure 5).

- “Advisory and service tools for forest owners” (51, 11 %) is the largest type of collected BP&I. This group comprises the range of information systems that are designed as decision-support tools for individual forest owners and managers, including practical planning and simulation tools. More and more of these tools come as apps that can be used on any mobile device.
- “Sensors, measurement equipment” (45, 10%). This represents the second largest group and it includes all sorts of enhanced data capture and measurement technologies, e.g. remote sensing-based systems such as satellite image analysis to drones, scanner and sensor systems for machines, monitoring solutions, etc. All represent key enabling technologies for the digitalization of the complex supply chains from forest ecosystem management to finished products.
- “Modelling, DSS, simulation, optimization” (41, 9%) and “Data platforms, data hubs, open data” (32, 7%): third and fourth main groups including more sophisticated information systems that cover a whole country or region or focus on a complex topic or offer a centralised data infrastructure.
- “Awareness, info portals, educational campaigns” (36, 8%): Tools aimed more to the general public or lay persons to provide better understanding and knowledge about forest use and products.
- “Data platforms, data hubs, open data, data standards” (34, 7%): databases to provide wide access
- “Sustainable, bio-based, circular products, smart materials” (33, 7%): (novel) products that can add high value to forest products, e.g. in paper industries or construction
- “Joint forest management” (29, 6%): forest owner associations, local/regional cooperative groups, etc

- “Smart machinery, equipment” (28, 6%): advanced harvesting or processing equipment
- “Collaboration platforms, logistical hubs” (28, 6%): specific tools to connect supply chain actors
- “Marketing platforms” (22, 5%): online portals for trade of forest products
- “Training, education, eLearning” (19, 4%): systems to support knowledge transfer to practitioners
- “Traceability tools” (18, 4%): specific solutions to trace timber rough the supply chain
- “R&D platforms, testbeds, co-creation initiatives” (17, 4%): specific funded projects and partnerships
- “Funding schemes, grants” (15, 3%): financial support schemes targeted at forest digitalization
- “Operations optimization” (8, 2%): tools that increase performance of typical operations
- “Cooperative initiatives, networks, clusters” (5, 1%): cross-disciplinary partnerships or projects
- “Smart biotechnologies” (4, 1%): biorefinery, high end applications
- “Innovation contests” (3, 1%): hackathons, prize competitions
- “Other” (21, 5%): other wood mobilisation solutions, not necessarily using digital approaches

The diverse solutions were grouped according to their main purpose, but their functionalities and applications are often overlapping. This assessment shows the range of digital-supported technological solutions and applications that exist in the forest sector, and portrays to some extent the trends in current development.

The long list of collected BP&I is the basis for the selection and validation of suitable BP&I to overcome regional barriers in the Hubs (chapter 4). The full list can be reviewed in Annex I.

3 Selection of BP&I and Preparation of Dissemination Material

3.1 Knowledge repository

3.1.1 Objective and concept

A main goal of the ROSEWOOD4.0 project is to develop and set up an open online knowledge repository that is widely accessible, easy to read and understandable by the target groups in the forest sector.

The main purpose is to provide **easy access** to useful information about practices and solutions that have proven as relevant and innovative to overcome common barriers and foster sustainable management and mobilisation of forest resources in the different climatic and socio-economic contexts of European forest regions. A focus are novel **digital solutions** and smart systems.

The **target groups** of the repository include mainly practitioners such as forest owners, forest managers, technicians and any other professional in the forestry and forest-based industries, but also people from other related industries as well as the public.

The final platform will serve as an **open repository**, which means that any stakeholder can access the information and submit new BP&I to be published on the platform via an online upload form. Such external submissions will be reviewed and approved before publication by an editorial team, which includes experts from the five Hubs and related partners, to cover a vast range of countries and topics.

The repository supports **multi-lingual access**, both in view of the included content and the search functions.

IW, EFI and SIG jointly developed the concept and implementation plan for the knowledge platform. The platform builds on the initial database and map viewer of the previous ROSEWOOD project, which are expanded and enhanced in their functionalities.

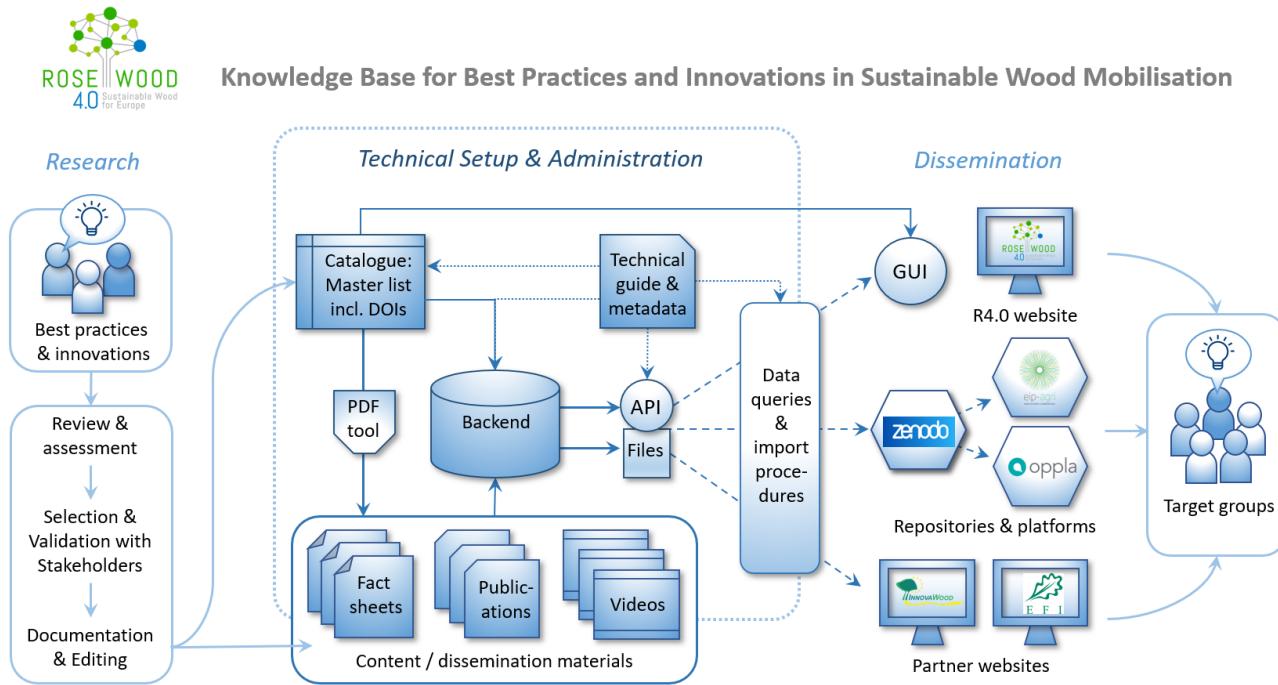

Figure 6 Graphic concept scheme of the Rosewood 4.0 knowledge repository

The knowledge repository comprises the following key components and features (Figure 5):

1. A central **backend database** collects the various contents in a structured way. The BP&I are collected in a catalogue which includes all collected descriptive data of the BP&I, images plus various references to additional contents in the form of publications, videos and external materials or websites.
2. The technical guide lays out the internal structure and metadata of the repository. It notably builds on the structure of a **BP&I factsheet dataset** with defined fields that contain all essential descriptors, classification codes and references (cf. Annex II). The factsheets exist both as HTML pages and as exportable PDF files that can be generated on the fly. Additional references use DOIs and active links.
3. The repository builds on the **research phase**, where Hub partners identify, select and document BP&I. It involves the assessment and editorial process to feed the data in the correct format into the repository. This is the collaborative process that is being trialled and demonstrated in WP1.
4. The **main frontend** graphic user interface (GUI) is the ROSEWOOD4.0 website, which provides open access to the repository to the various target groups. The GUI enables any user to query the database using various search and filter functions to rapidly explore the information contained in the repository. The repository supports multilingual content.
5. The repository structure allows also make the data accessible for **other platforms** or partner websites, for example through import procedures or API queries. These can include specific thematic platforms (e.g. nature-based solutions, circular economy) maintained by certain R&D communities, networks, industry groups or initiatives with a specific regional focus.
6. Specific final outputs of the ROSEWOOD4.0 (e.g. final reports, presentations, dissemination materials, videos) will also be stored on the **Zenodo.org** open access repository, developed under the European OpenAIRE program and operated by CERN, to ensure long-term access of all main results.

The backend and frontend have been programmed and installed on the web (CESEFOR, EFI, IW).

3.1.2 BP&I common factsheet template

A detailed factsheet template (cf. Annex II) was defined as part of the repository development. This common factsheet defines the agreed contents to be completed for every BP&I before publication in the knowledge repository. It expands the initial dataset of the raw data collection during the screening phase (cf. chapter 2.1) and defines all necessary items to ensure full contents, functionality, and consistency of the repository.

The template includes the following sections and elements:

- Internal code and date of entry of BP&I
- Language of content (multilingual versions of BP&I)
- Main factsheet contents:
 - titles, teaser statement, keywords
 - geographical and temporal references
 - domain and solution type classifications
 - abstract text, including assessment e.g. cost/benefit analysis
- Contact data:
 - lead owner/author of BP&I
 - intermediary project partner (reporter)
 - consent for publication
- Resources and references: DOIs and URLs
- Additional optional features: further classification parameters
- Picture materials: visuals, logos, photos, copyright info, descriptive captions

To ensure that many BP&I can be processed, and that the repository can be easily appended further by external partners and in the future, the documentation should be as easy as possible. The main idea is to provide an **efficient tool** that collects only a **concise description** about a BP&I solution and **guides** the interested reader to further accessible content and sources.

The template structure is consistent with the **EIP-AGRI common format for practice abstracts**¹. Although the ROSEWOOD4.0 template is more complex for the purpose of the repository, it allows to extract the key info BP&I in a correct manner that is consistent with the EIP-AGRI format. It is thus ensured that the final BP&I collection can simultaneously feed into the EIP-AGRI knowledge database.

To start the collection and documentation of BP&I, an Excel file was created for partners to save the data of the factsheets while the online database is not operative yet. Once operative, the data file is transferred to the database of the knowledge platform, the usage of this Excel file will be discontinued, and authors of factsheets will be requested to enter and edit new factsheets directly in the online frontend.

3.1.3 Frontend for end-users

The new frontend of the repository is redesigned to match ROSEWOOD4.0 visual identity, which applies both to the webpage and the factsheets.

- **Enhanced search functions** and visualisation of results to allow for more query options and an attractive user experience.
- **Good readability** of contents in the search tools and factsheet viewer that are well designed and aligned with various visual elements such as photos, graphics, videos, and logos.

¹ <https://ec.europa.eu/eip/agriculture/en/eip-agri-common-format>
https://ec.europa.eu/eip/agriculture/sites/default/files/annex_to_eip_guidelines_on_eip_common_format_-_16_march_2016_0.pdf

- **Interactive map viewer** to display location of and statistics about the BP&I identified in a query result. The viewer allows to zoom into results and depicts contextual geoinformation.
- BP&I having received **higher interest** from users will be highlighted in the search results. A “Like” button is the most simple, straightforward solution to rank results based on collected user feedback.

Because the frontend is still under development, all further features will be described in detail in the Technical note of the repository (deliverable report D1.7).

3.1.4 Multilingual access

The frontend includes a **fully-fledged multilingual functionaliy**, in order to ensure a widest possible access to the content by national target groups. Because forestry is still a quite traditional and rural profession, information that is only accessible in English can hardly be disseminated successfully with wider impact. The project team decided therefore to undertake a main effort to implement a multilingual repository.

English is the compulsory main language in which all BP&I must be documented by the editorial team comprised of Hub members. The repository is however able to incorporate **all other main European national languages**. Therefore, the responsible editorial partner is asked to provide at least one national translation of each BP&I, if not more. In fact, any BP&I factsheet can be stored in many language versions, and the frontend interface can be accessed in any national language chosen by the user.

Matching results	English	Spanish	German	Danish
1				
2				N.A.
3				N.A.

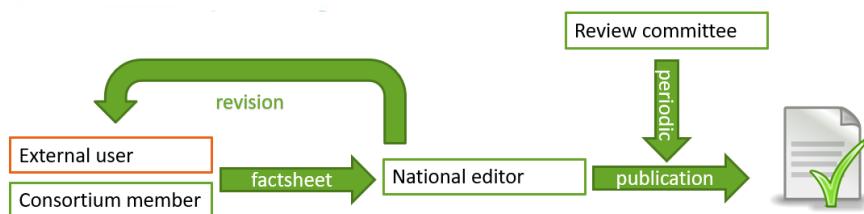

Figure 7 Example of multilingual access of an end-user that can read English, German and Danish

The interface supports even **simultaneous searches in multiple languages**. When performing a query, besides the selected main language, the end-user will be able to select other languages that he/she can read. The query returns the matching results in the following order of priority:

- Matching results in selected main language,
- Matching results in other languages that the end-user can read (from top to bottom priority),
- Matching results in English (even if not selected in other languages that the end-user can read).

3.1.5 Editorial process and data management

To ensure that information to be included in the knowledge repository is consistent, complete, and correct, a peer review procedure will be implemented by an **editorial team**. The editorial team comprises a group of nominated persons (reviewers) from the Hubs who oversee performing a crosscheck and approval of the BP&I factsheets, before they are published openly in the knowledge repository. The editorial team meets on a regular basis (i.e. once per quarter) to review progress of new content to be published in the repository. The editorial team is chaired by EFI and IW.

- **Reviewers** will take over assignments to review sets of factsheets and the annexed additional reference materials, propose necessary corrections or revisions to the authors of a factsheet if necessary, and approve the material when it has been finalized accordingly. The main aspects are that the factsheets contain complete content and useful pictures, that the text is readable and informative, that some references and additional material are included, and that the consent by the BPI owner/author has been provided accordingly. Currently, the reviewers are represented by staff members of the Regional Hub Lead partner organisations (NE: LUAS, CWE: HCS, SWE: CESEFOR, CEE: FORZA, SEE: CEKOM). They can assign tasks to prepare or review factsheets to other members in their regional hubs as well as national editors.
- **National editors** have a supporting role to check the national language versions, which are usually translations from the original BPI abstract in English. Here more reference persons become involved who can read and check the texts in specific language, in case that the reviewer cannot do it. This job can also be given to professional translators. The editorial team maintains the list of persons nominated as national editors.

Registered access to the knowledge repository is granted to Hub members and reviewers, so they are allowed to edit and process data directly in the repository via the online interface. Many persons can work on the data in the repository remotely and simultaneously, which makes the editorial process very efficient. The editorial team decides and oversees the access rights.

External users usually own the collected BP&I, i.e. the knowhow, the product, the tool, the patent, or simply the content of a publication that is used as reference material. Therefore, the **consent of the owner or main author** needs to be obtained prior to the publication of a factsheet. They can give their consent directly in the knowledge repository (YES/NO tick boxes the factsheet form sent as a special website link to them for confirmation) or in written form (e-mail, letter). Hub partners are responsible to contact the concerned organisations or persons and collect their approval.

In short, the consent of publication comprises the following terms:

- I am the owner/author/partner of the BP and am in an eligible position to provide this confirmation.
- I am just an intermediate. The owner provides the written consent to the Terms by e-mail.
- Any public funding or IPR has been duly acknowledged (e.g. EU projects, trademarks, ...)
- I give consent to the privacy terms/GDPR, Cookies, Google Analytics etc. (for internal usage).
- I confirm that my contact (name and e-mail) can be published in the factsheet. YES/NO.

External users are **explicitly invited to contribute** as well to the platform, because the goal is to establish a fully open platform. Any external users can view and query the information in the ROSEWOOD 4.0 platform, but they are not foreseen to register in the platform, and so they are not allowed to edit the data directly.

To make their contribution as easy as possible, an external user can also submit BP&I factsheets to the repository via an open online form of the common factsheet template. Their contribution can be considered for publication by the editors, provided that they communicate personal contact data (name and e-mail) and confirm their approval of the terms and conditions of the knowledge repository (compulsory).

3.1.6 Implementation of the knowledge platform (beta version)

The first beta version of the online platform was launched on 10 Sep 2021. The web interface was designed and programmed by EFI and CESEFOR based on a Wordpress platform. It is accessible under the weblink: <https://www.forestinnovationhubs.rosewood-network.eu/en/>

- *Main page:* the main interface consists of the query box and the preview list. The query allows to search for keywords or any term (text string) and apply filters on the main category fields (country, type, language, domain, challenge, etc). The result of a search is a list of relevant selected BPI which are presented in a

mosaic or a list view. Each mosaic tile includes the BPI title, short description, a thumbnail picture, main keywords, the available languages, and links to websites and resources (videos, downloads).

- *Factsheet public view:* Each factsheet can be opened by the user through simple click. The factsheet view provides the full abstract, all visual items, and the detailed additional information (categories, contacts, references, additional resources).
- *Factsheet edit mode:* Project partners and stakeholders (reviewers, editors, expert) obtain an own user account with secure login. They can then directly add, edit, and publish factsheets. The edit form gives them direct access to revise texts, classify the categories and edit all items.
- *Factsheet language versions:* The translation view is a special edit function, where the editor creates a copy of an existing factsheet and then translates it into the new language.

The usability of the query form is still being tested and several adjustments are foreseen. All consortium partners were given the opportunity to provide feedback on the layout (two dedicated meetings were held for that purpose). The external Advisory Board members provided also useful feedback. The adjustments are being implemented directly, so the platform remains permanently accessible online.

3.1.7 Long term vision of the knowledge platform

IW, EFI and SIG will decide before the end of the project on a **long-term agreement** to maintain the knowledge platform. It will ensure that all results remain accessible for at least 5 years beyond the project lifetime (to be detailed in deliverable report D1.7). The platform shall be linked with various other platforms e.g. EIP-AGRI, ERIAFF, FTP, SCAR, EFI's Bioregions Facility, etc. As an open tool, the ROSEWOOD 4.0 platform will be continued as channel for dissemination and business exploitation of the Hubs and other regional initiatives in the forest-based sector. All main functionalities and essential curation of contents will be ensured. It is also an option to include the platform in further projects e.g. under Horizon Europe or regional funds.

3.2 Preparation of Dissemination Materials

3.2.1 Collection of BP&I abstracts

The Hub partners are working to complete the BP&I factsheet collection using the agreed common format. The focus is on those BP&I factsheets that have been selected as priority for the Hubs (cf. chapter 4).

Currently the platform contains 271 BPI (1 November 2021). The editing and proofreading of the first batch of 50 BPI factsheets which were identified as first priority for the Hubs has been completed (see D1.3). Besides English, translated texts in at least one national language were completed.

The second batch of another 50 BPI is still work in progress. The list of selected BPI has been agreed and the factsheets in the platform are to be completed by the editors until end of December 2021.

EFI has developed a corporate identity and first general dissemination material (cf. D4.1 – D4.4). These provide a common basis for informing about the project and its objectives and are used during the communication of Hub members with external experts and stakeholders and the wider dissemination started during the last months. The ongoing activities can be followed on <https://rosewood-network.eu>.

3.2.2 Creation of short videos

A key output for ROSEWOOD 4.0 dissemination will be a **series of short video clips** realized by the Regional Hubs. The aim is to develop attractive, informative audio-visual film material to present a selected group of BP&I to a wide audience. Hub partners are in charge to realize the videos with support from local film crews or journalists as service providers.

To ensure consistent quality, a set of **guidelines for video production** was provided to partners by EFI (cf. Annex III). It was decided to produce short films of 3-5 min length that portray a specific BP&I using interviews/short statements from practitioners and visual footage of the BP&I “in action”. The video shootings and editing of clips are work are ongoing. More than half of the videos have been completed (Table 1).

The **selected BP&I** for the videos are considered by the Hubs as highly promising solutions to overcome typical regional barriers for wood mobilization using digitalization, smart technology, and collaborative approaches. The following selection list is a result of the validation process (cf. chapter 4).

Table 1 BP&I selection for video clip production per Regional Hubs (work progress status 1 Nov 2021)

Hub	No.	Best practice	Country	Partner	Status
NE	1.	Virtual Forest / Virtuaalimetsä 2.0	FI	LUAS	Video
	2.	Joint wood terminals	FI	LUAS	Video
	3.	FeltGIS Ltd	NO	Tretorget	In prep.
	4.	Use of drones in vocational education	NO	Tretorget	In prep.
	5.	Arboair - Detecting bark beetles with AI	SE	Paper Prov.	Video
	6.	HighVision - Virtual reality support for crane operators	SE	Paper Prov.	Video

	25.	RecAPPture - mobile app for collection of used wood	SI	SFI	Video
	26.	Public data of forests	HR	CEKOM	Video

Notes: Regional Hub abbreviations - NE Northern Europe / CWE Central-Western Europe / SWE South-Western Europe / CEE Central-Eastern Europe / SEE South-Eastern Europe

4 Clustering and Validation of BP&I between regions

4.1 Validation of BP&I

4.1.1 Selection and prioritisation

ROSEWOOD4.0 accomplishes a two-level validation: a) **EU level / whole project**, and b) **Hub level**. A validation served to review the selection results carried out in the Hubs, to review the dissemination material under preparation, to collect comments for clarification and improvement, and to approve the final BP selection, the final dissemination materials, and further related activities (e.g. training actions). A main purpose has been to align the Hub priorities and to steer the selection towards the most impactful results for the whole project.

In the validation step, **BP&I selections, and rankings** of different Hubs were compared, and common priorities and interests of different regions as developed in the Regional Roadmaps under WP2 were identified. For this, the results of the SWOTs were used and BP&I were matched against the regional needs identified. By doing this, BP&Is of the longlist were prioritised according to the regional priorities in terms of knowledge transfer between Hubs.

To produce a **global priority list** for the whole project, BP&I across all regions were analysed. Regions with common interest were paired to work jointly on the elaboration of BP&I documentation and develop mutually beneficial knowledge exchange and training activities.

The European-level validation helped to analyse the prioritised BP&I and collect additional evidence or arguments to describe the high relevance of the selected BP. For example, this took a closer look at Technology Readiness levels (TRL), cost/benefit analysis, practical benefits for a region and the Hub stakeholders, measures to address bottlenecks for implementation, and/or consider policy impacts and other cross-regional priorities.

4.1.2 Validation workshops with stakeholders

To validate the BP&Is selected as well as the materials, a series of **3 workshops per Hub** was implemented, involving project partners within the 5 Hubs and interested invited experts and stakeholders. The content of the workshops had been designed to also allow some time to validate the results of other WPs, in order to not involve experts in too many workshops.

The 3 workshops are organised in the following order and logic of contents:

- 1) **First workshop**
 - a. validation of SWOT from WP2 (prioritisation of needs)
 - b. selection / pre-assessment of Hub BPs
 - c. selection of Hub BPs for videos
- 2) **Second workshop**
 - a. validation of BPs selection and first materials
 - b. prioritisation of other Hub BPs (to cover needs of the Hub)
 - c. directions of Hubs Roadmaps and implementation steps (e.g. new initiatives)
- 3) **Third workshop**
 - a. draft knowledge platform, needs of practitioners, validation
 - b. presentation of training course concept from WP3
 - c. validation of 2nd batch materials
 - d. follow up on Hub Roadmaps and implementation steps (WP2)

Regarding the preparation of dissemination materials and the validation, best practices owners were involved, as far as they were willing to support. The selection and the involvement process of these external contributors has been described in D6.1, relating ethical issues of the process.

Owing to the restrictions of the COVID-19 pandemic, most workshops so far needed to be carried out by partners as **online web conference meetings**. The team thus needed a bit more time for adaptation of the procedure and the preparation of the workshops.

Although this has been challenging, partners are now confident with the good results obtained. A positive aspect that has been recognized is that it has turned out quite easy to involve experts from other countries in these online meetings, which enabled for **direct exchange between Hubs** and regions already during the second round of validation workshops.

The following validation workshops have been accomplished until Nov 2021 (Table 2). The participants, main contents and outcomes of the workshops are documented in internal Minutes reports to the Steering Committee.

Table 2 *Regional Hubs validation workshops for BP&I assessment and Roadmaps*

Hub	Lead organizer	WS no.	Date	Number of participants		
				Partners	Stakeholders	Total
1-NE	LUAS, Paper Province, LUKE	WS1a	10/06/2020	10	5	15
		WS1b	23/09/2020	9	5	14
		WS2	17/02/2021	10	5	15
		WS3	21/09/2021	10	5	15
2-CWE	HCS, FBZ, CNPF	WS1	17/09/2020	8	3	11
		WS2	03/03/2021	13	49	62
		WS3	22-23/09/2021	11	4	15
3-SWE	Cesefor, AIEL, ISA, CNPF	WS1	24/06/2020	11	14	25
		WS2	03/12/2020	12	10	22
		WS3	26/04/2021	7	9	16
4-CEE	FORZA, ITD, PROWOOD, NFC	WS1	25/09/2020	13	21	34
		WS2	18/11/2020	17	14	31
		WS3	25/10/2021	13	24	37
5-SEE	CEKOM, SFI, CluBE	WS1	18/06/2020	12	15	27
		WS2	28/09/2020	7	27	34
		WS3	17/03/2021	15	29	44

The validation workshops have been useful ‘soundboards’ as a means to obtain feedback and suggestions of external stakeholders regarding the project results. The stakeholders comprised practitioners and experts that are very experienced and familiar with the local conditions of their region or country inside the Regional Hub. Most of the stakeholders (40%) represented research organisations or academia, followed by providers of

transversal services (26%; ICT companies, trans-sectorial clusters, development agencies, etc.). This trend was shared by all hubs except in NE Hub, where it was inversed. Forest policymaking and forest managers represented 9% and 8% of the stakeholders, respectively. Lower shares (between 1% and 3%) were for forest owners associations, wood harvesting and logistics companies, wood processing industries, pulp and paper industries, machinery manufacturers and companies consuming wood-based products (e.g. furniture manufacturers, construction companies, printers, etc.).

This over-representation of stakeholders from research and academia in this kind of events is very common in thematic networks and it is due to the work flexibility of these professionals. It may not be negative *per se*, as researchers can play the role of “honest broker” of best practices and innovations. The considerable number of providers of transversal services is due to 1) the large spectrum of this category, and 2) the fact that many of these providers are companies developing industry 4.0 innovations that can be features as ROSEWOOD4.0 factsheets.

Finally, on-line workshops allowed a higher number of attendees and reached the same objectives, when compared to the in-person ones.

4.2 Synergies for knowledge exchange between Regional Hubs

Each Regional Hub developed a **shortlist of priority BP&I**, which were selected as a result of the exchange with regional experts during the road mapping process and the discussions in the validation workshops. The results from the workshops and roadmaps of different Hubs were combined and analysed by WP leader IW in view of common interests and complementarities. The Hub shortlist include a) BP&I from the own Hub and b) BP&I from other Hubs. The following matrix tables provide the detailed overview of the BP&I distribution corresponding to the priorities of each Hub (Table 3 & 4).

In total, 171 BP&I were shortlisted by the Hubs as potentially relevant for their needs, of which 79 BP&I originate from within the own Hub, and a total of 92 BP&I from other Hubs. The SWE Hub selected only 19 BP&I, because their first focus was on exchange between the partner countries inside the Hub. In contrast, the SEE Hub selected a total of 56 BP&I, which of 32 are BP&I from other Hubs.

Note: This analysis is based on the initial BPI long list (April 2021). BP&I that were added later are not included.

Table 3 BP&I selection: overview statistics per Hub

Hub	Total BP&I own Hub	Total BP&I other Hubs	1-NE	2-CWE	3-SWE	4-CEE	5-SEE	7-EU & 8-INT	Total BP&I selected
1-NE	16	10	16	6	2	2	-	-	26
2-CWE	18	21	13	18	5	-	1	2	39
3-SWE	17	2	-	2	17	-	-	-	19
4-CEE	4	27	8	11	3	4	4	1	31
5-SEE	24	32	9	15	2	5	24	1	56
Total	79	92	46	52	29	11	29	3	171

Note: The total figures per other Hubs include double counting of BP&I selected simultaneously by several Hubs

The ranking according to the declared interest of Hubs allows to further refine the selection (Table 4). A majority of a total 106 BP&I were chosen by only one Hub. However, a total of 30 BP&I were picked to be relevant to

several Hubs. These include 23 BP&I with interest from two Hubs and 7 BP&I with interest from 3 or more Hubs. They also show a fair balance of BP&I from all Hubs.

Table 4 *BP&I selection : ranking of possible synergies per Hubs*

Number of Hubs with declared interest	Total BP&I count	1-NE	2-CWE	3-SWE	4-CEE	5-SEE
1 (Hub internal)	106	17	23	16	22	28
2 (Hub bilateral)	23	13	13	1	10	9
3 or more (multi Hub)	7	3	4	2	5	7
Total	136	33	40	19	37	44

Note: The total figures include double counting of BP&I selected simultaneously by several Hubs

The following main conclusions can be drawn from this analysis:

1. The selection confirms the high potential for cross-regional exchange and knowledge transfer between the Hubs. The selection differs between Hubs and shows different strategies, but they reveal a strong interest in innovations from outside the region. The highest interest according to this count attracted BP&I from the CWE Hub; but all other Hubs gained mutual interest for their BP&I.
2. The total number of 171 BP&I covers a broad range of solutions. Overall, the selection is sufficiently balanced and represents a sound basis to match priority BP&I with several Hubs and topics.
3. Regarding the majority of the Hub-internal group, the further analysis and dissemination of these BP&I is mostly of an internal interest that will be handled inside the particular Hub, or as a bilateral activity between the interested party and the BP owner/author.
4. The group of 30 BP&I of interest for several Hubs is clearly relevant for a wider European community. They will be the focus to start initiating joint bilateral and multi-lateral dissemination and transfer actions that will be fostered by the ROSEWOOD4.0 project.

5 Annex

5.1 Annex I: BP&I collection long list

Total list of **457** collected BP&I as of 1 November 2021.

5.2 Annex II: BP&I factsheet template for Hub partners

Field descriptor	Compulsory Description of the content	Inputs in English	characters	Inputs in national language	characters
Code (automatic number)	- generated by system				
Date of entry (automatic)	- generated by system				
Language	Yes Language of the content	English			
Main content and features					
Title of the factsheet	Yes Meaningful title, avoid acronyms. Max 100		0 of 100		0 of 100
Title (national name)	No If national name is main identity. Max 100		0 of 100		0 of 100
Title (abbreviation)	No if specific name, brand or acronym of solution				
Teaser statement	Yes Short descriptive text summarising the content (subtitle). Max 250 characters.		0 of 250		0 of 250
Keywords	No Limit to 4 keywords, free of choice. Separate by comma				
Geographical scale	Yes EU, cross-border/multi-lateral (several countries)				
Geographical unit 1	Yes Main location: country(es) and NUTS				
Start year	Yes Start year of development / launch				
End year	No End year (e.g. a project). Leave empty if still ongoing				
Domain 1st (main)	Yes Main domain. If more than one domain, name them separated by commas				
Domain 2nd	No Do not repeat!				
Domain 3rd	No Do not repeat!				
Digital solution	Yes Is this best practice a digital solution? (Yes/No)				
Type of solution	Yes Single choice, select the most relevant one.				
Innovation	Yes Is the factsheet describing an innovative best practice?				
Abstract	Yes Should contain: context, objective, main results, lessons learned, main recommendations.		0 of 1500		0 of 1500
Contact data					
Contact lead organization	Yes Provider/owner/author of the information				
Contact lead person	Yes Name of person for reference and contact				
Contact lead e-mail	Yes e-Mail address (published only if consent is given)				
Contact lead website	No if available				
Consent for publication	Yes Confirmation of owner/authorship and consent				
Consent for contact details	Yes Consent to publish contact details in factsheet				
Contact intermediary organisation	Yes Rosewood 4.0 partner organization (for internal communication)				
Contact intermediary person	Yes Name of person (for internal follow-up)				
Contact intermediary e-mail	Yes e-Mail address				
Resources and references					
Main website	No URL of the website of the best practice or its project	https://		https://	
Project reference	No Name of project, grant number and/or funding				
Project website	No Website of project or funding	https://		https://	
Resource 1 title	No short title for reference				
Resource 1 link	No URL (DOI if possible)	https://		https://	
Resource 1 file upload	No PDF for direct access, if available				
Resource 2 title	No short title for reference				
Resource 2 link	No URL (DOI if possible)	https://		https://	
Resource 2 file upload	No PDF for direct access, if available				
Resource 3 title	No short title for reference				
Resource 3 link	No URL (DOI if possible)	https://		https://	
Resource 3 file upload	No PDF for direct access, if available				
Additional features (optional)					
Geographical unit 2	No Other countries/regions/localities, if applicable				
Geographical unit 3	No Other countries/regions/localities, if applicable				
Geographical unit 4	No Other countries/regions/localities, if applicable				
Geographical unit 5	No Other countries/regions/localities, if applicable				
Type wood	No Type of wood, wood/tree species, or wood products				
Origin of wood	No Source of wood, type of supplier or industry				
Mobilization potential	No numerical (give values in m ³ /ha if possible) by mode of transport				
Kind of wood concerned	No free text				
Sustainability potential	No parameter (from 1 to 5: 1: very positive; 2: positive; 3: neutral; 4: negative; 5: very negative)				
Impact on environment & biodiversity	No free text				
Ease of implementation	No parameter (from 1 to 5: 1: very easy; 2: easy; 3: neutral; 4: difficult; 5: very difficult)				
Economic impact	No parameter (growth of the company / turnover)				
Job effect	No free text				
Income effect	No free text				
Specific knowledge needed	No free text				
Costs of implementation	No numerical (value in €) + free text				
Exploitation potential	No free text				
Key prerequisites	No free text				
Picture material					
Picture 1 visual	Yes Main picture or image to illustrate the best practice				
Picture 1 copyright	Yes Author / owner of picture reference (gives permission to use)				
Picture 1 caption	Yes Description/explanation of picture content				
Picture 2 logo of best practice	No Logo of the best practice, if available. To be uploaded in the document				
Picture 3 logo of main organization	No Logo of main organisation/owner/author, if available				
Picture 4 logo of project	No Logo of project or funding organisation, if available				
Picture 5 additional visual	No For illustration				
Picture 6 additional visual	No For illustration				
Picture 7 additional visual	No For illustration				

5.3 Annex III: Guidelines for video production

Basic guidelines

Clarity - What content is expected to be included in the video? What questions should be answered?

- What new features does this best practice or innovation have? What does it offer?
- Who is the developer? Who is using it? Who is it for?
- Why is it necessary? Why is it an improvement for professionals or the sector? Benefits?
- How is it applied? How does it work and improve daily tasks? (live and on-stage demonstration)

Concision - Brevity with key messages (summarise the most relevant of the innovation or best practice)

- Length of video (time range): 3 - 5 minutes

Coherence - Inclusion of interviews (statements) combined with footage of best practice and innovation on the spot (forest / outdoors). At least, two different voices in the videos:

- Provider of the innovation or best practice
- Any stakeholder or practitioner who is implementing or enjoying already its benefits

Consistency - Some technical specifications must be met in all videos, as well as the implementation of the corporate visual identity of the project

Intro: ROSEWOOD logo (placed in the middle of the screen) and title of the innovation/best practice.

Body (rest of the video): Motion titles should be in font Abel Regular (main title) Calibri light (subtitle).

- Background colour of titles: Midnight blue (#1f3040 / R31 G48 B64) ↗ next slide
- Supplementary colours in titles: Colour palette used in brochure ↗ next slide

Ending: A frame showing all the logos of the project partners and the H2020 project disclaimer with the EU flag (Files will be saved in WP1 “Videos” Teams folder)

Other tech specs

- Recommended video filming format: Full HD 1920x1080
- Exported files in high and low quality in MOV and MP4 format (Youtube & social media)

Colour scheme

Complementary colours for other elements if needed

COLOR PALETTE

Midnight colour

Main background colour
for motion titles

CMYK: 40 | 0 | 98 | 0
RGB: 168 | 205 | 27
WEB: # ABCD1BE
PANTONE: 375 CP

CMYK: 58 | 0 | 100 | 4
RGB: 76 | 187 | 23
WEB: # 4CBB17
PANTONE: 369 CP

CMYK: 100 | 35 | 0 | 2
RGB: 0 | 122 | 197
WEB: # 007ac5
PANTONE: 3005 CP

CMYK: 0 | 0 | 0 | 65
RGB: 135 | 135 | 135
WEB: # 999999
PANTONE: Cool Gray 8 CP

TINTS AND SHADES

Example of video frame

- Motion title graphics use Abel Regular font (name) and Calibri light font (job title)
- Main background colour applied (midnight blue) and a complementary colour from the palette (grey).
- Font size in this example: 60 for main title & 40 for subtitle

Questions & Answers

Q: When do the videos have to be ready? How much time do we have to do this task?

A: According to the project plan, the videos will have to be uploaded to the Knowledge Platform in September (M21) after the 3 months extension we have (D1.4). We recommend starting the production of the videos as soon as possible between February-June. You can plan to produce one video per month or concentrate the production of the 5 videos per regional hub in a specific month. Once you have produced them, contact EFI for dissemination and communication actions (WP4).

Q: What language should the videos be in? What happens if an interviewee does not speak English? Do they have to be dubbed or subtitled?

A: The videos must be in English, but obviously if an interviewee does not speak English, it is better that they express themselves in their native language and then subtitles are added in English (not dubbing). The approach should be to prioritise English whenever possible. We recommend that subtitles should be in Calibri font and in white (more legible).

5.4 Annex IV: Impressions from validation workshops
